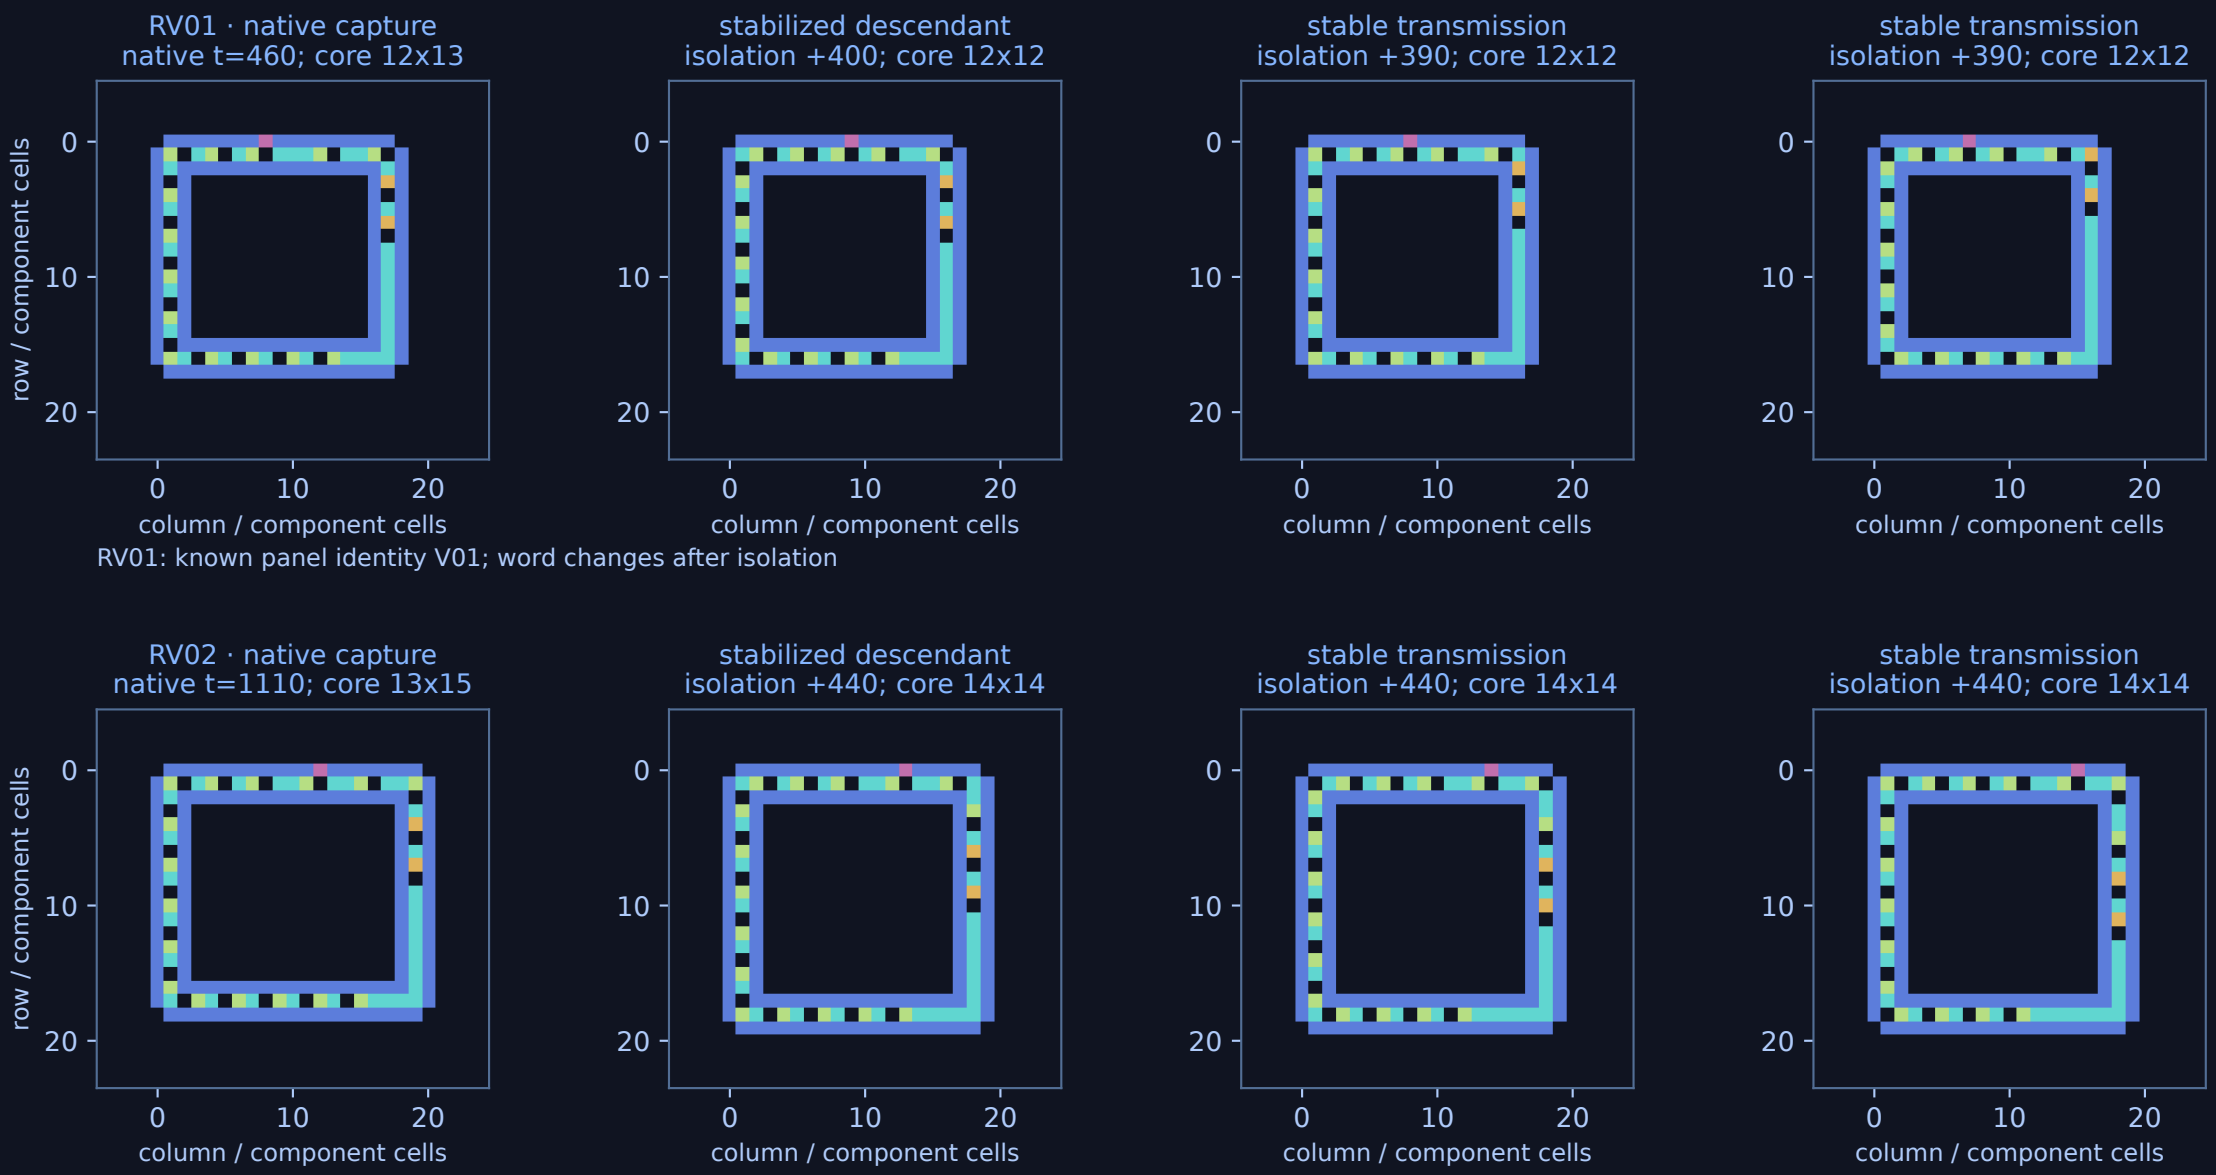
Actual recovered inheritance paths · EXP-atlas-002



RV01: known panel identity V01; word changes after isolation

RV02: absent from input catalogue; native word retained

Complete occupied components and arms retained; same cell scale; coordinates relative to each component origin.
Native capture clock differs from each restarted isolation clock. Detachment sampled every 10 updates.
Final three components share one composite identity: two stable transmissions. Pair-level novelty; native ancestry ambiguous.
Serial isolation is an intervention. Benefit not assayed; these paths do not establish autonomous native inheritance.
