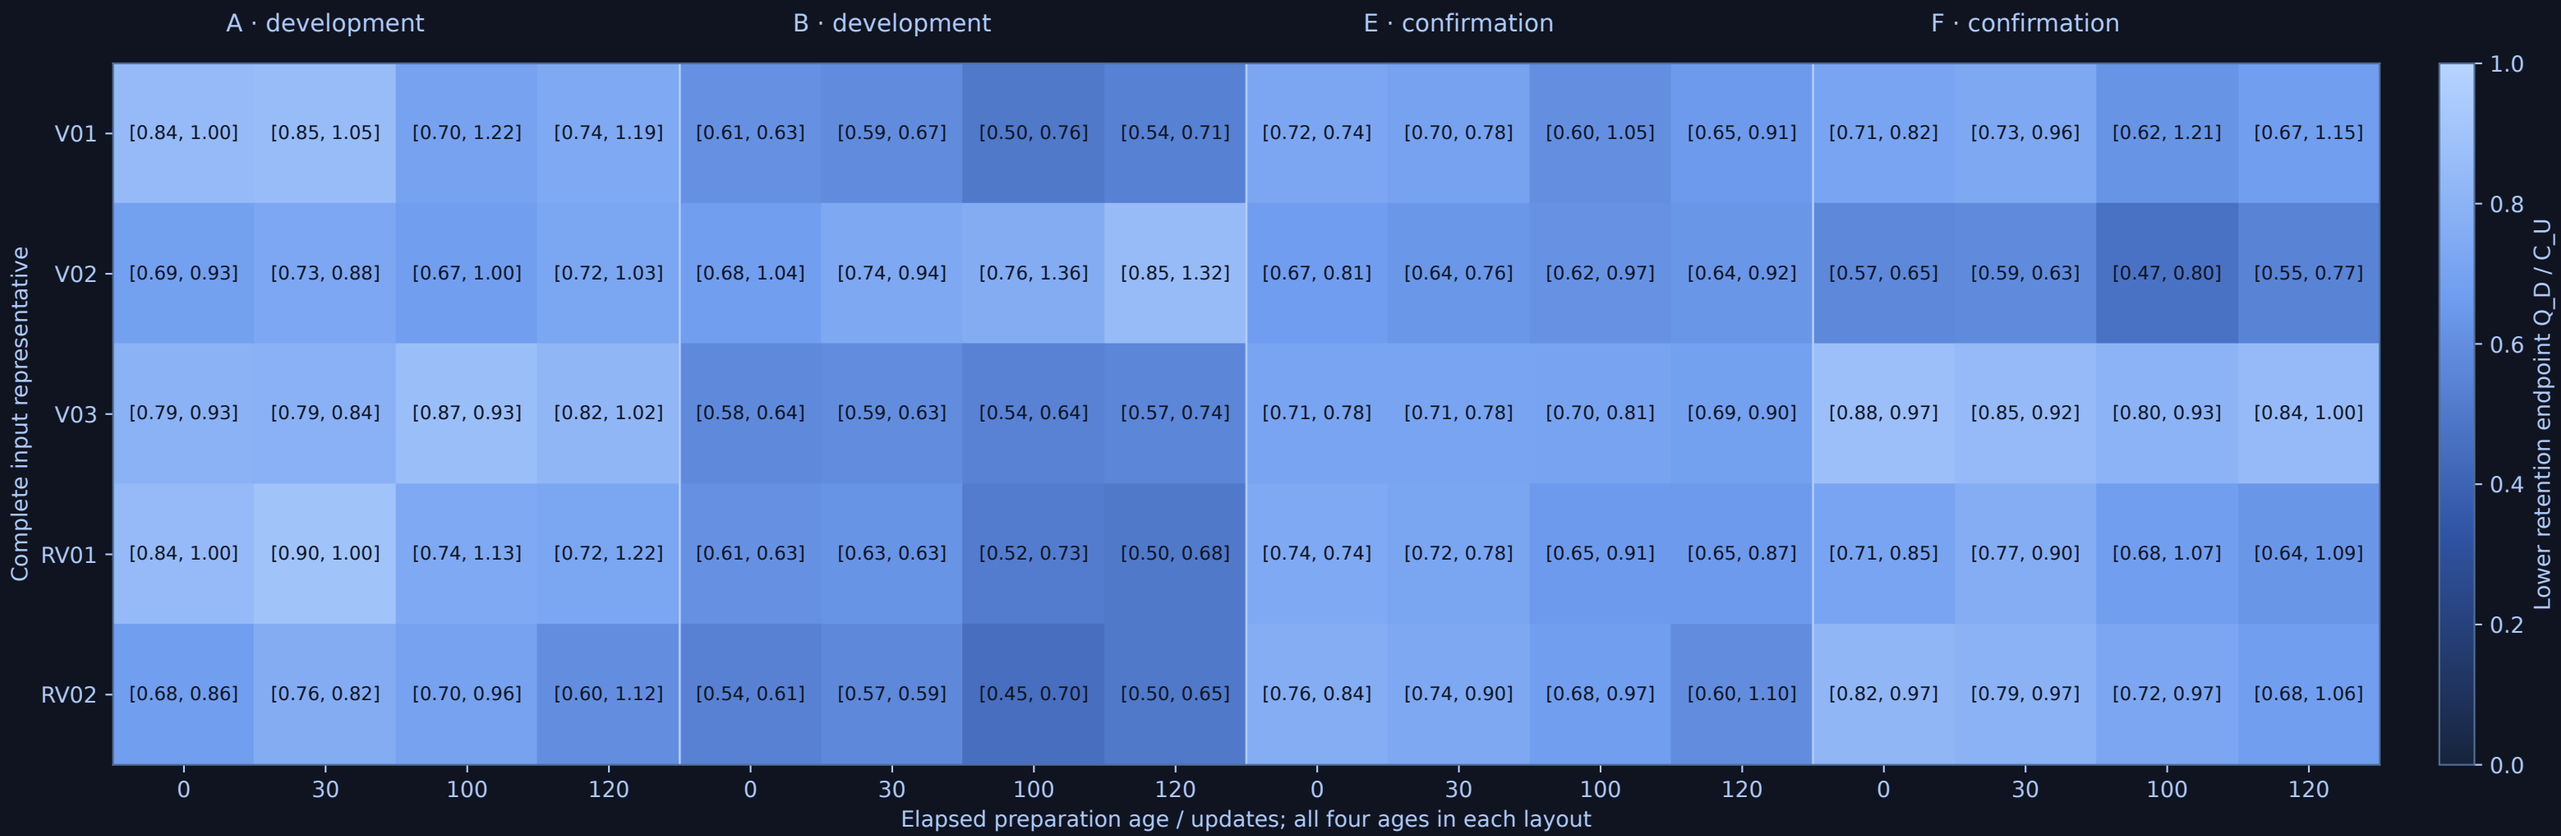
Crossed recovery retention envelopes · EXP-age-geometry-cross-001



[Q_D/C_U, C_D/Q_U] from five census times 0/400/800/1200/1600; labels rounded only for display.
All 80 state × age × layout conditions shown. Q confirms isolated source recovery; C includes every detected core; unresolved sources remain in C.
Missing controls and infinite endpoints use labels and hatching. These envelopes concern detected source bodies; they are not viability bounds or confidence intervals.
D removes one complete clone; U is undisturbed. A/B develop, E/F reserve distinct starts; earlier A-age0/B-age100 observations are repeated checks.
