
Overall calibration gate: PASSED; original phase controls 30/30; omitted-input controls 3/3.
Scored recovery 726/799; separate scored-state and resolved-share gates remain frozen.
Five source times 0/400/800/1200/1600 per world; all shared, capped, nonproductive and ineligible sources remain unresolved R.
Q counts delay-zero complete-component recovery, C all detected cores; [Q,C] does not bound all viable organisms.
Finite deterministic sources; repeated inputs and controls are not independent populations. Unknown genotype does not prevent recovery.
